Sixty years ago the company Alprem, which evolved from a general locksmith business, introduced the first aluminium window on the market. This was revolutionary at the time, and it paved the way for the production of other aluminium joinery for construction and interior fittings. In 1972, Alprem developed the first window without a metal core, and two years later, it improved its product and unveiled the first aluminium window with a thermal bridge.

In an era marked by large-scale construction projects, Alprem consolidated its reputation and the company's products were installed in several well-known and recognizable buildings, prominently featured throughout the country. Alprem always adapted to the market and expanded its range of products. Due to the growth in production and the number of employees, which rose to as high as 400, the company moved to a new location in Kamnik, where its headquarters are located to this day. In 1998, Alprem was transformed into Alu alprem, which builds on the rich tradition of its predecessor. Our professional team has continued to strengthen its presence both on the domestic and western European markets. We strive to always offer something new to our clients and have been among the first producers of joinery for passive houses.
